

SINERGIAPS

INVENTORS: Institut d'Investigació Sanitària Illes Balears

HIGHLIGHTS

- ✓ It helps to visualise deficiencies in health facilities.
- ✓ Different questionnaires that are being updated

TECH STATUS

- ✓ TRL9
- ✓ Intellectual property rights

Background and Technology

The SinergiAPS tool aims to help primary care health centres in Spain to improve patient safety. The tool is based on the use of information provided by the patients themselves, who represent a group that is often ignored despite being a relevant source of information for the improvement of healthcare processes.

This tool consists of a computer programme that allows both the collection of information from patients through a validated and electronically administered questionnaire and the automatic creation of specific reports for each health centre with the results of the questionnaires and a series of recommendations on how to improve the safety problems identified.

Applications

The use of this tool is that health posts can continuously improve patient safety based on patients' own assessments.
